

What my code does:

I take 2 inputs from the user. I check to make sure the inputs are integers and are between my set numeric parameters. I add each corresponding number together and compare them to see if

Sum #1 + Sum #2 + Sum#3 are all equal

1. 2 strings input by user
2. Convert to int
3. Check to make sure both values are integers
4. Create a new method that will return a bool
5. Index both numbers
6. Add their corresponding integers together
7. Return value to main (true or false)
8. Display True or False to user
